

The Truth about Vaccines

The Pharmaceutical Industry Exposed

Part 1

2020 has been fraught with fear and misinformation in the media. We are told by the King of vaccines and eugenics, William Gates that life will not return to normal unless the whole world is vaccinated for Covi-19. It is uncanny that this college dropout has become the King of the vaccine industry. If you did not know better, you might believe that Bill Gate was the official authority on vaccines or perhaps he studied under the mentorship of Dr. Anthony Fauci of the NIAID. Dr. Fauci at least has a M.D. from Cornell University in upstate New York. We find that Bill Gates derives his illusionary power through the power of wealth, thus the media panders to his lies and deceptions. All one has to do is look into the Gates Foundation and its activities in Africa and Asia.

Bill Gates insists the world will not return to normal until he can vaccinate the 7.8 billion people in the world. I am not a doctor, and neither is Bill Gates, and so I see him as my equal in a lesser degree. He dropped out of Harvard in his sophomore year of pre-law.

I have an earned BA degree in a triple-major of History/Pre-Ministry/Accounting from a Christian college. I don't need to add my seminary degrees and so we ask the question, what merits Gates' television all the TV air time before the public? Really, what makes this pedophile so important that he is a routine face on the propaganda networks?

The meme above answers my rhetorical question. A couple weeks ago I read Dr. Vernon Coleman's book *'Anyone Who Tells You Vaccines Are Safe and Effective is Lying'*. Dr. Coleman is a retired UK GP doctor. The book is a basic synthesis of the issues that refute the validity of vaccines. I have been reading another book *'Vaccine Mania'*

The entire basis for vaccines came with Louis Pasteur was a scam. You would have heard about "the germ theory of disease", attributed to French microbiologist and chemist Louis Pasteur. The theory is the cornerstone of modern medicine, and he also developed the process, named after him, of pasteurization. But what you would not have heard, is that just like the theory, Louis Pasteur was a fraud.

He died in 1895, and while the knowledge of his fraud was back then, fairly widespread, and it didn't really get into the media, and it wasn't until 1923 when Ethel Douglas Hume wrote her book *'Bechamp or Pasteur'*. Bechamp was another French scientist and microbiologist, a contemporary of Pasteur's, and he was the one who did all the real work, and Pasteur just stole most of his stuff. In fact, the book's title was later changed to *'Pasteur Exposed'*. Two decades later, R.B. Pearson published another work *'Pasteur, Plagiarist, Impostor'*, which the name was later changed to *'The Dream and Lie of Louis Pasteur'*.

It wasn't until later in the 20th century that Pasteur's lab notes were released to the public. His family tried to hide them for many years. Pasteur even insisted that his records be kept secret long after his death. Why so? One of the first people to

thoroughly review his notes was Gerald Geison. He wrote an article in the *New York Times* in 1995, and he declared that Pasteur was a fraudster. His “germ” theory was a lie, as was his vaccine research, and all of his ideas were largely stolen from his contemporaries and plagiarized.

Two of his contemporaries were Antoine Bechamp, the one I mentioned before in the 1923 book, and Claude Bernard. Bechamp discovered that germs, bacteria, and viruses were pleomorphic, meaning they could change from one type of organism to another. Bernard expanded on this, finding out that the environment was responsible for causing these changes. Pasteur admitted his fraud on his deathbed, claiming “*The Germ is nothing. The Terrain is everything.*” Apparently Dr. Anthony Fauci has never read of Pasteur’s confession. Dr. Fauci, like Louis Pasteur, has secrets that would hurt his pride. Dr. Fauci claim to fame was the HIV=AIDS and he is fighting to keep the truth of his errors sealed.

The germ theory itself was something that Pasteur actually plagiarized too. This was around for centuries before he was born, as a theory; because back then they didn’t have microscopes, and sometime after the invention of the microscope, it was actually 1762 there was an Italian physician M.A. Plenciz. He published his germ theory of infectious disease, claiming that there was a special organism which could cause infections, and that it could also reproduce outside the body, and transports itself through the air. His work was what Pasteur mainly plagiarized from.

Other ideas stolen by Pasteur include Bechamp’s discoveries that molds and ferments were living organisms, ferments were responsible for diseases in grapes (there was a big problem in the vineyards back then), parasites were the cause of silk worm disease (another problem of those times), Pasteur also produced serums for rabies and anthrax, which were also stolen, and they were colossal failures. For example, people were dying from his vaccines, instead of those diseases, and in the case of rabies where you hear how horrible it is, Pasteur’s vaccine was far, far worse. It was a nightmare.

The life of Louis Pasteur is really interesting. There is a lot of information and unfortunately you just can’t squeeze it into a small video. You could easily do a 2-hour documentary on his lies and fraud, so if you want to learn more, check out those books and articles I referenced previously. That’s a good start.

The real question is why is this imposter glorified by society and modern medicine? The truth is that his theories, even though they have been disproven, are highly profitable for the pharmaceutical industry. With the public duped into believing the germ theory of disease, it opens the door for them to sell useless pharmaceutical medications. It’s a multi-billion dollar industry, and the works of Louis Pasteur are really crucial to their ongoing success. That was confirmed in an article I by the American Intelligence Media that I posted in my article “***Pharmageddon***”.

If the sheep keep believing, the sheep will keep demanding and buying their products. They are making a lot of money out of it, so they will fight tooth and nail to make sure

that his theories are still popularized, even though they are all frauds, they are all fake, and have been proven wrong.

Those in the business of creating vaccines continue perpetuate the fraud. The real issue is not the “Germ” theory. The proper focus should be on the “Terrain” theory. The Terrain theory is about the environment issue where pathogens invade the human biome. Life existence has improved incredibly since the days of Pasteur. Greater focus on providing clean water, sanitary procedures, hygiene, and efforts to prevent pollution of air, water, and earth conditions that lead to sickness, disease, poisoning of human life. Even the Bible shows God instructed the Israelites on sanitary waste matters. **““You shall have a place outside the camp, and you shall go out to it. And you shall have a trowel with your tools, and when you sit down outside, you shall dig a hole with it and turn back and cover up your excrement.”** -(Deuteronomy 23:12-13). During the middle Ages, the Jews were accused of causing the plague because it did not touch them or pass them by. We know this was due to their hygiene and sanitary practices.

As Dr. Coleman noted in his book, vaccines have never cured any viruses. The evidence of this is seen in the statistics of the WHO, CDC, and other public health agencies. If anything, they spread the viruses they are supposedly being injected to save human life. Bill Gates is 100% wrong in his stupid ideas concerning vaccines.

If you're giving a drug to a patient who is dying then risks and side effects are less significant than if you're giving a drug for a relatively minor illness. Vaccines are usually given to healthy patients, and so it is important that the risks are very small, and side effects preferably transient and insignificant.

The crazed lunatics running public health today have been deceived into thinking that vaccines are the only way of achieving a bacteria free world. I have news for them that is not even possible no matter how hard the pharmaceutical industry tried. The prime example is the matter of Autism. Twenty years ago Autism was a virtual unknown. Today, the rate of Autism is 1 in 24 boys and 1 in 36 girls. In the Amish community, where they do not vaccinate, the rate is non-existent!

In fact, the “Gold Standard” in microbiology and molecular biology is known as the Koch Postulates.

I will discuss Robert Koch later in this article on how he continued his thirst for knowledge on infectious diseases by experimenting with tuberculosis in 1884. He was able to determine four postulates:

1. The putative organism must be constantly present in diseased tissue.
2. The organism must be isolated in pure culture.
3. The pure culture must induce disease when injected into experimental animals.
4. The same organism must be isolated from these diseased animals.

The fact is that today, the “germ” theory of Pasteur and Dr. Fauci cannot pass the Koch “Postulates”. No virus has ever been scrutinized or studied where the Koch “Postulates”. No agency can prove their argument when Koch’s Postulates are followed. This may come as a surprise to all of you, but it is an indisputable fact. The “germ” theory has never been confirmed to be true. Never, never, never!

The above “tweet” reveals the stupidity and arrogance of Mr. Bill Gates. The moron is nothing more than a dupe for the New World Order using the corona virus as a manipulative way to beat the drums of fear and obtain voluntary submission! It is all a huge scam from the pit of hell.

A MAN OF GREAT INFLUENCE...

The deep pockets of Microsoft's owner are used to fund the creation of new viruses so that they Pharmaceutical Industry can use the Hegelian Dialectic to fill their pockets with billions of dollars in profits. Problem-Reaction-Solution or Thesis-Antithesis-Synthesis!

In this case it is:

1. Create the problem – release the Corona virus
2. Cause a reaction – we need a vaccine or we all die
3. Offer the solution – Moderna and other pharmaceuticals race to bring out their vaccine.

I've said for months it was intended to kill the elderly, those most vulnerable due to comorbidity issues that have weakened their bodies in advanced years.

This is a summary from Dr. John Coleman's book, *'Anyone Who Tells You Vaccines Are Safe and Effective is Lying'*.

1. Sadly, many modern vaccines are neither safe nor effective. Pro-vaxxers steadfastly and obsessively believe that all vaccinations are safe and effective all the time. This is patently not true. The World Health Organization has admitted that the vaccines pushed by the WHO and Bill Gates have caused a polio outbreak in Sudan with several children now paralyzed as a result. Here are some more facts about vaccines which your government (and pro-vaxx journalists) may have forgotten to tell you...
2. Some vaccines (such as those administered nasally) contain millions of live but attenuated viruses. These viruses may sometimes become live and can mutate. In 2016, the Center for Disease Control in the USA, withdrew the nasal flu vaccine because it was not effective. Nasal vaccines can cause serious neurological and behavioral side effects.
3. Making a vaccine in a few months instead of many years massively increases the dangers. Some serious side effects do not appear for years after vaccination. Giving a relatively untested vaccine to seven billion people (as is planned with the Covid-19 vaccine) may result in hundreds of thousands dying or being made seriously ill.
4. The H1N1 flu vaccine resulted in lawsuits all over the world. The British Medical Journal has reported that months before serious side effects were reported, both the manufacturer and public health officials knew about the danger.
5. GlaxoSmithKline (one of the drug companies making a Covid-19 vaccine) has been fined many times. For example, after pleading guilty to federal criminal offences GSK agreed to pay a fine of \$3 billion. The largest health care fraud in US history. The company was fined \$490 million for bribery in China. There is a list of some of the fines paid by GSK on www.vernoncoleman.com.
6. The British Government paid out £60 million to patients who had been damaged by GSK's Pandemrix vaccine. (GSK had demanded that the Government indemnify it against claims for damages). The British Government has to pay out so much money to the parents of children damaged by some vaccines that there is a fixed fee of £120,000 per severely damaged child. In the United States, the Government has paid out over \$4 billion for vaccine injuries. That money has been paid to 18,000 individuals. That's a lot of money for governments to pay out for treatments that are supposed to be perfectly safe. In the 2019 fiscal year, \$131,485,775 was paid out to vaccine damaged individuals in compensation.
7. The UK's Chief Scientific Officer, Sir Patrick Vallance, worked for GSK between 2006 and 2018. By the time he left, he was a member of the board. Vallance is enthusiastic about a new vaccine for covid-19.

8. Other vaccine manufacturers also have a terrible safety record. Astra Zeneca is also preparing a vaccine for Covid-19. There is a list of fines paid by Astra Zeneca on www.vernoncoleman.com. I suggest you read the details before accepting a vaccine made by the company.
9. No long-term, independent research has been done to compare the health of children who have had a full set of vaccinations against the health of children who have had no vaccinations. Surely, if the vaccinators had faith in their product that would be the first research they would do? Pro-vaxx supporters refuse to debate the value of vaccination.
10. No long-term, independent research has been done to measure the inter-reaction between vaccines and prescription drugs.
11. Does repeated vaccination weaken the immune system? No long-term, independent research has been done to measure the effect of vaccination on the immune system.
12. No research has been done to check whether giving so many vaccines to small children causes health problems.
13. Patients who suffer from serious side effects after a covid-19 vaccination will not be able to take legal action for damages. Drug companies, governments and doctors are all protected from litigation – even if patients are paralyzed for life.

The history books tell us this about Louis Pasteur:

Louis Pasteur; (December 27, 1822 – September 28, 1895) was a Roman Catholic French chemist and microbiologist born in Dole, France. He is remembered for his remarkable breakthroughs in the causes and preventions of disease. His discoveries reduced mortality from puerperal fever, and he created the first vaccine for rabies. His experiments supported the germ theory of disease. He was best known to the general public for inventing a method to stop milk and wine from causing sickness, a process that came to be called pasteurization. He is regarded as one of the three main founders of microbiology, together with Ferdinand Cohn and Robert Koch. Pasteur also made many discoveries in the field of chemistry, most notably the molecular basis for the asymmetry of certain crystals. His body lies beneath the Institute Pasteur in Paris in a spectacular vault covered in depictions of his accomplishments in Byzantine mosaics.

Louis Pasteur was born on December 27, 1822, in Dole in the Jura region of France, into the family of a poor tanner. Louis grew up in the nearby town of Arbois. He gained degrees in Letters and in Mathematical Sciences before entering the École Normale Supérieure, an elite college. After serving briefly as professor of physics at Dijon Lycée in 1848, he became professor of chemistry at the University of Strasbourg, where he

met and courted Marie Laurent, daughter of the university's rector, in 1849. They were married on May 29, 1849, and together had five children, only two of whom survived to adulthood, two died of typhoid and one of a brain tumor. These personal tragedies inspired Pasteur to try to find cures for diseases such as typhoid.

In Pasteur's early work as a chemist, he resolved a problem concerning the nature of tartaric acid (1849). A solution of this compound derived from living things (specifically, wine lees) rotated the plane of polarization of light passing through it. The mystery was that tartaric acid derived by chemical synthesis had no such effect, even though its chemical reactions were identical and its elemental composition was the same.

Upon examination of the minuscule crystals of sodium ammonium tartrate, Pasteur noticed that the crystals came in two asymmetric forms that were mirror images of one another. Tediously sorting the crystals by hand gave two forms of the compound: solutions of one form rotated polarized light clockwise, while the other form rotated light counterclockwise. An equal mix of the two had no polarizing effect on light. Pasteur correctly deduced the molecule in question was asymmetric and could exist in two different forms that resemble one another as would left- and right-hand gloves, and that the biological source of the compound provided purely the one type. This was the first time anyone had demonstrated chiral molecules.

Pasteur's doctoral thesis on crystallography attracted the attention of M. Puillet and he helped Pasteur garner a position of professor of chemistry at the Faculté (College) of Strasbourg.

In the year of 1854, Louis was named Dean of the new Faculty of Sciences in Lille. In 1856, he was made administrator and director of scientific studies of the École Normale Supérieure.

Germ theory

Pasteur demonstrated that fermentation is caused by the growth of microorganisms, and that the emergent growth of bacterium in nutrient broths is not due to spontaneous generation but rather to biogenesis.

He exposed boiled broths to air in vessels that contained a filter to prevent all particles from passing through to the growth medium, and even in vessels with no filter at all, with air being admitted via a long tortuous tube that would not allow dust particles to pass. Nothing grew in the broths unless the flasks were broken open; therefore, the living organisms that grew in such broths came from outside, as spores on dust, rather than spontaneously generated within the broth. This was one of the last and most important experiments disproving the theory of spontaneous generation. The experiment also supported germ theory.

While Pasteur was not the first to propose germ theory (Girolamo Fracastoro, Agostino Bassi, Friedrich Henle and others had suggested it earlier), he developed it and

conducted experiments that clearly indicated its correctness and managed to convince most of Europe it was true. Today he is often regarded as the father of germ theory and bacteriology, together with Robert Koch.

Pasteur's research also showed that the growth of microorganisms was responsible for spoiling beverages, such as beer, wine and milk. With this established, he invented a process in which liquids such as milk were heated to kill most bacteria and molds already present within them. He and Claude Bernard completed the first test on April 20, 1862. This process was soon afterwards known as pasteurization.

Beverage contamination led Pasteur to the idea that microorganisms infecting animals and humans cause disease. He proposed preventing the entry of microorganisms into the human body, leading Joseph Lister to develop antiseptic methods in surgery.

In 1865, two parasitic diseases called pébrine and flacherie were killing great numbers of silkworms at Alais (now Alès). Pasteur worked several years proving it was a microbe attacking silkworm eggs which caused the disease, and that eliminating this microbe within silkworm nurseries would eradicate the disease.

Pasteur also discovered anaerobiosis, whereby some microorganisms can develop and live without air or oxygen, called the Pasteur effect.

Immunology and vaccination

Pasteur's later work on diseases included work on chicken cholera. During this work, a culture of the responsible bacteria had spoiled and failed to induce the disease in some chickens he was infecting with the disease. Upon reusing these healthy chickens, Pasteur discovered that he could not infect them, even with fresh bacteria; the weakened bacteria had caused the chickens to become immune to the disease, even though they had only caused mild symptoms.

His assistant Charles Chamberland (of French origin) had been instructed to inoculate the chickens after Pasteur went on holiday. Chamberland failed to do this, but instead went on holiday himself. On his return, the month old cultures made the chickens unwell, but instead of the infection being fatal, as it usually was, the chickens recovered completely. Chamberland assumed an error had been made, and wanted to discard the apparently faulty culture when Pasteur stopped him. Pasteur guessed the recovered animals now might be immune to the disease, as were the animals at Eure-et-Loir that had recovered from anthrax.

In the 1870s, he applied this immunization method to anthrax, which affected cattle, and aroused interest in combating other diseases.

Pasteur publicly claimed he had made the anthrax vaccine by exposing the bacillus to oxygen. His laboratory notebooks, now in the Bibliotheque Nationale in Paris, in fact show Pasteur used the method of rival Jean-Joseph-Henri Toussaint, a Toulouse

veterinary surgeon, to create the anthrax vaccine. This method used the oxidizing agent potassium dichromate. Pasteur's oxygen method did eventually produce a vaccine but only after he had been awarded a patent on the production of an anthrax vaccine.

The notion of a weak form of a disease causing immunity to the virulent version was not new; this had been known for a long time for smallpox. Inoculation with smallpox was known to result in far less scarring, and greatly reduced mortality, in comparison with the naturally acquired disease. Edward Jenner had also discovered vaccination, using cowpox to give cross-immunity to smallpox (in 1796), and by Pasteur's time this had generally replaced the use of actual smallpox material in inoculation. The difference between smallpox vaccination and cholera and anthrax vaccination was that the weakened form of the latter two disease organisms had been generated artificially, and so a naturally weak form of the disease organism did not need to be found.

This discovery revolutionized work in infectious diseases, and Pasteur gave these artificially weakened diseases the generic name of vaccines, to honor Jenner's discovery. Pasteur produced the first vaccine for rabies by growing the virus in rabbits, and then weakening it by drying the affected nerve tissue.

The rabies vaccine was initially created by Emile Roux, a French doctor and a colleague of Pasteur who had been working with a killed vaccine produced by desiccating the spinal cords of infected rabbits. The vaccine had only been tested on eleven dogs before its first human trial.

This vaccine was first used on 9-year old Joseph Meister, on July 6, 1885, after the boy was badly mauled by a rabid dog. This was done at some personal risk for Pasteur, since he was not a licensed physician and could have faced prosecution for treating the boy. However, left without treatment, the boy faced almost certain death from rabies. After consulting with colleagues, Pasteur decided to go ahead with the treatment. The treatment proved to be a spectacular success, with Meister avoiding the disease; thus, Pasteur was hailed as a hero and the legal matter was not pursued. The treatment's success laid the foundations for the manufacture of many other vaccines. The first of the Pasteur Institutes was also built on the basis of this achievement.

Legal risk was not the only kind Pasteur undertook. In *The Story of San Michele*, Axel Munthe writes of the rabies vaccine research:

“Pasteur himself was absolutely fearless. Anxious to secure a sample of saliva straight from the jaws of a rabid dog, I once saw him with the glass tube held between his lips draw a few drops of the deadly saliva from the mouth of a rabid bull-dog, held on the table by two assistants, their hands protected by leather gloves.”

Because of his study in germs, Pasteur encouraged doctors to sanitize their hands and equipment before surgery. Prior to this, few doctors or their assistants practiced the procedure of washing their hands and equipment.

Allegations of deception

In 1995, the centennial of the death of Louis Pasteur, the *'New York Times'* ran an article titled "Pasteur's Deception". After having thoroughly read Pasteur's lab notes the science historian Gerald L. Geison declared that Pasteur had given a misleading account of the preparation of the anthrax vaccine used in the experiment at Pouilly-le-Fort

Faith and spirituality

Pasteur's faith was as genuine as his science. In his panegyric of Littré, whose fauteuil he took, he wrote:

Happy the man who bears within him a divinity, an ideal of beauty and obeys it; and ideal of art, and ideal of science, an ideal of country, and ideal of the virtues of the Gospel.[16]

These words are also engraved above his tomb at the Institut Pasteur. In his address Pasteur said further:

"These are the living springs of great thoughts and great actions. Everything grows clear in the reflections from the Infinite."

Some of his letters to his children demonstrated a profound piety. In one, he declared:

"The more I know, the more nearly is my faith that of the Breton peasant. Could I but know all I would have the faith of a Breton peasant woman."

He was puzzled by the failure of scientists to recognize God's existence from their observations of the world around them.

Louis Pasteur was the Edward Jenner of France. He conducted all kinds of ghoulish experiments on animals in order to prove his germ theory of disease. His ancestors were Huguenots who were forced to embrace Romanism by the Inquisition. Jenner was a Jesuit like Dr. Anthony Fauci. This point is important in our understanding of the mind-set of Dr. Fauci and his ego.

It was revealed a month ago, in September, 2020, that Dr. Fauci requires of his subordinates to see that any and all media references to Dr. Fauci are put in his mail box. His self-obsession and self-absorption should be of great concern to the public. It is a sign of an obsessed narcissist. From my research and study, it is my belief that Dr. Fauci fears exposure for his falsely labeling HIV=AIDS. He diagnosed Chronic Fatigue Syndrome as HIV and the cause of AIDS. Evidence to the contrary and researchers of his equal or better were destroyed to protect his secret.

Honors and final days

His death occurred in 1895, near Paris, from complications of a series of strokes that had started in 1868. He died while listening to the story of St Vincent de Paul, whom he admired and sought to emulate. He was buried in the Cathedral of Notre Dame, but his remains were reinterred in a crypt in the Institut Pasteur, Paris, where he is remembered for his life-saving work.

Pasteur won the Leeuwenhoek medal, microbiology's highest Dutch honor in Arts and Sciences, in 1895.[23] He was a Grand Croix of the Legion of Honor—one of only 75 in all of France. Both Institute Pasteur and Université Louis Pasteur were named after him.

Statements

In his triumphal lecture at the Sorbonne in 1864, Pasteur said "Never will the doctrine of spontaneous generation recover from the mortal blow struck by this simple experiment" (referring to his swan-neck flask experiment wherein he proved that fermenting microorganisms would not form in a flask containing fermentable juice until an entry path was created for them).

Robert Koch was a brilliant microbiologist who decided to expand on the findings of Louis Pasteur. So, he devised his own experiment. After he studied *Bacillus anthracis*, a bacterium that caused the disease known as anthrax, he devised an experiment that dealt with the infectivity of *Bacillus anthracis*. He began by isolating the bacterium in a culture and proceed to experiment with it in mice. He injected the bacterium into a mouse and waited to see what happened. Fifty hours after the injection, death had taken place, and the organism didn't show any vitals. Shortly after death, Koch extracted blood from the dead mouse and cultivated another culture, where the bacteria grew. After the growth, Koch repeated the experiment and extracted the bacterium from the newly grown culture. He proceeded to inject another mouse and afterward he saw the same symptoms and a similar time of death to the first mice. As he was conducting this experiment, he paid close attention to the tissues of the dead mice and came across something peculiar. He saw that every single mouse that died from anthrax had the same rod-shaped bacteria, *Bacillus anthracis*, although he wasn't certain on how the disease was transmitted or how the bacteria managed to survive between hosts.

Koch then continued his thirst for knowledge on infectious diseases by experimenting with tuberculosis in 1884. He was able to determine four postulates:

1. The putative organism must be constantly present in diseased tissue.
2. The organism must be isolated in pure culture.
3. The pure culture must induce disease when injected into experimental animals.
4. The same organism must be isolated from these diseased animals.

Koch's Postulates are referred to as the "Gold Standard", and remains the central principles of determining the existence of a virus, pathogen, and is foundational learning in all of the biological sciences. In the many reports on the Internet by doctors such as Dr. Zack Bush, Dr. Nancy Mikovits, Dr. Andy Kaufman, Dr. Leonard Horowitz, and many others, they all raise questions to the lack of Dr. Anthony Fauci and fellow vaccine advocates to follow proper protocol guidelines in their allegation that the Corona virus or Covid-19 actually exists. Critics of Dr. Fauci and his crowd of fellow Jesuit Dr. Robert Redfield and other are justified since they have claimed that Covid-19 is going to be with us forever.

After Pasteur's experience with fermentation and spontaneous generation, Pasteur felt ready to expand his knowledge of what he knew of microbiology. In the spring of 1865, Pasteur decided to undertake a project that dealt with a silkworm disease. This disease had caused devastating harm to the silkworm industry in southern France and delayed the production of silk. Today, this disease is known as pébrine or pepper disease. Some physical characteristics of this disease were the tiny black spots on the skin of the worms and a change of color of the silkworm eggs. Rather than being yellowish, the shell of the infected silkworm eggs had a grayish tone. As Pasteur became intrigued with this problem, he looked deeper into the disease that not only affected the silkworm at a physical level but must have also affected them at a physiological level as well. When the infected silkworm hatched, it would stay put and look for a quiet place, unlike its healthy counterparts who would look for leaves to feed on immediately after hatching. This disease caused the silkworms to die at an alarming rate and they also weren't able to spin a cocoon of silk that could be used in the textile industry, thus, creating an alarming problem when it came to the production of silk.

Pasteur soon began to take notes of these accounts and saw a pattern. He saw that any of the silkworms who carried the tiny black spots were infected and those who were free from these spots were relatively healthy worms. Soon he ordered for any silkworm with spots to be stopped from breeding, in order to stop this disease once and for all. But as spring came, he realized he had made a dreadful mistake in his experiment. After the silkworms hatched, he saw that the eggs that came from what he thought were healthy silkworms, had infected silkworms. This meant that Pasteur had to rethink his idea of the type of disease that was affecting the silkworms. After examining the silkworm generation that hatched in the spring, he noticed that some of the silkworms that didn't have the black spots died while others who had the black spots survived. This was a mystery that puzzled Pasteur for three years.

Pasteur concluded the possibility that they were suffering from two different diseases rather than just one. These two diseases were caused by separate microorganisms. One of the microorganism lived in the silkworm while the other lived in the black globules or spots that were present on the skin of the silkworm. Soon, Pasteur realized that both of these diseases were spreading to other living silkworms from a single infected silkworm. After making this realization, all Pasteur had to do was to figure out how this disease was able to spread from an infected organism to a healthy organism. He found that the uninfected silkworms had one thing in common: mulberry leaves. This

leaf was conventionally used to feed silkworms since it is the only kind of leaf they will eat. Pasteur then conducted a test to see if his theory was true, and indeed it was. It was revealed to him that if an infected silkworm laid dropping on the leaf and an uninfected silkworm ate it, the uninfected silkworm would contract the disease. One disease was recognized to be flacherie, an infectious disease that attacked the intestines of the silkworm and caused diarrhea. This problem was soon resolved by distinguishing whether a silkworm was suffering from pébrine or flacherie, and then stop them from breeding. And this was how Pasteur was able to save the silk industry from certain doom.

After deducing that these two diseases originated from two separate microorganisms, Pasteur became interested to see if all diseases were caused by environment-based germs. After analyzing data for a period of ten years, Pasteur had sufficient evidence to back up his claim that microorganisms caused diseases. He named his theory the germ theory of disease and it was a revolutionary step in the world of both microbiology and medicine. After his theory was published, people began to believe that microorganisms caused disease rather than miasma and soon enough the miasma theory was soon forgotten; but Pasteur still wanted to surpass Koch in the field of immunology and microbiology. So, he made it a challenge to himself to find a cure for rabies.

But before he was able to publish his germ theory of disease, there was an indirect contributor to the germ theory. This man was Edward Jenner, a country surgeon in the late eighteenth century who was born in Berkeley, England, nearly sixty years before Pasteur developed the germ theory of disease. His major contribution to germ theory was that he was the first person in the records to make a vaccine against smallpox. Smallpox was caused by a virus that entered the human respiratory tract and incubated for a period of twelve days. After roughly twelve days, the patient encountered symptoms such as fever, malaise, muscle aches, headaches, and pustules that covered the face and the extremities. After the disease had settled, the pustules turned into scabs that permanently disfigured their victims for the rest of their lives, if they even managed to survive this deadly disease.

Jenner had had a close life-or-death encounter when he was in his youth. At the age of eight, his school had fallen victim to an epidemic of smallpox and Jenner soon contract smallpox. After he was diagnosed, Jenner went through a process known as variolation, where he was bled until his blood was “thin.” This process was repeated until he had the appearance of a skeleton. At this point, Jenner was inoculated with a live virus of smallpox, and surprisingly, Jenner survived and was able to continue his studies.

Jenner grew up, and he became a country surgeon. And he encountered a peculiar scenario. He overheard a milkmaid say she would never have to suffer from smallpox because she had already contracted cowpox, a weakened version of smallpox that affected cows. This gave Jenner an idea of injecting a perfectly healthy human with cowpox to see if it indeed protected a person from smallpox. But he had to wait for the perfect time to conduct this experiment. The opportunity soon arose in the spring of 1776, when an outbreak of cowpox had taken place near Berkeley, England. From here,

Jenner extracted blood from a milkmaid who was suffering from cowpox, and by May 14, he had inoculated a boy who had the exact same age as Jenner when he had suffered from the smallpox virus. After being injected with cowpox, the eight-year-old boy, James Phipps, suffered a mild fever for two days but survived. Afterward, the boy was exposed to the smallpox virus not once but twice, and he still didn't get sick. This proved to be a revolutionizing technique that would affect millions of human lives in the following centuries. After this, Jenner was recognized as a pioneer and the father of immunology. But even though he made this significant discovery, it was rejected by his peers, and Jenner was even taunted by members of the Protestant Church. They would have drawings of cows growing on people's skin after they had been vaccinated with the cowpox virus. Although his work wasn't taken seriously, Pasteur recognized Jenner's potential and started an experiment of his own: to conquer rabies once and for all.

Pasteur began his quest to eradicate rabies by creating a vaccine for it. In the nineteenth century, rabies was fairly common in developed countries. Rabies was essentially a virus that targeted the nervous system of an organism and it was normally transmitted through a bite from a rabid animal. But there was only one catch to this story; Pasteur wasn't able to see this microorganism through his microscope. Although all stakes were stacked against him, Pasteur was able to cultivate this invisible agent of disease in his laboratory, and he conducted an experiment to see if he could copy what Edward Jenner had done.

He first found a dog that was suffering from rabies and extracted a sample from the dog's spinal cord. In order to do so, Pasteur had to perform trepanation on the dog. After extracting the sample, they suspended the samples in dry, sterile air with caustic potash to prevent putrefaction and allowed oxygen to weaken the virus over a period of two weeks. After the two weeks, new dogs were inoculated with emulsions from the spinal cords that had been dried for fourteen days. As this process continued, it proved to be effective in dogs and caused an immunity to rabies, but this didn't mean that it was meant for human use too. Pasteur created a vaccine for rabies in dogs, but his hands would have been tied for the scenario that presented in front of him in July of 1885. A boy by the name of Joseph Meister had been bitten by a rabid dog and his parents were pleading for Pasteur to use the vaccine on the innocent child. This placed Pasteur in a risky situation because the vaccine for rabies was used to prevent rabies, not treat rabies. If this didn't work, Pasteur was putting his reputation and livelihood at risk by evening thinking of performing this experiment on a nine-year-old boy.

Ultimately, Pasteur opted to try out the experiment on July 7, 1885, by treating young Meister with the rabies vaccine. As the days passed, little Joseph was beginning to feel better and soon enough, he was on his way to his hometown. Luckily for Pasteur, his bet had given fruit to a new vaccine that could treat rabies, even after the virus was in the organism. This proved to be an extraordinary finding because, over the course of fifteen months after Meister was treated for rabies, 2,490 lives had been saved by the vaccine. Today, this vaccine is still being used in circulation and it has saved millions of lives from a certain death sentence.

Although only three examples of Pasteur's work in science was mentioned, he was able to do other numerous applications that helped industries. For example, after determining that spontaneous generation was indeed a false theory, he was able to industrialize pasteurization. Through this, bacteria were now able to be removed from the products and it was also able to prolong the products in the dairy industry.

The "germ theory" of disease has stood as one of the most important theories to be developed during the nineteenth century and proved to shake the science community. It created an everlasting impact that shifted the way scientists saw diseases and how they were caused. This also gave scientists an insight into what was really happening at the microscopic level of a wound that had been infected. A significant change it made in the field of clinical medicine was the sterilization of tools during an operation. Before germ theory, during an operation unsterile equipment had been used to remove a tumor or a bullet that had lodged in the body. This meant that there was a high chance that during the operation, the wound was going to be infected. This just shows one of many impacts germ theory had on the world. Overall, Pasteur was an unreplaceable scientist that took risks, such as his job or reputation, to improve the overall human life. He was a pioneer who sparked the movement on infectious diseases that forever changed the field of microbiology. As a result, Pasteur is remembered for his discoveries in fermentation, pasteurization, and vaccination of rabies.

Dr. Thomas Cowan has addressed the possible connection between the coronavirus and 5G. This is a question that was first brought to my attention by Dr. Thomas Cowan in a couple of YouTube videos, which may or may not still be viewable thanks to the rampant big tech censorship going on right now. Then, if you try using that ubiquitous search engine to learn more, you'll see results from the MSM going out of their way to discredit Dr. Cowan and mischaracterizing what he said.

But why are they working so hard to silence this point of view? Who gains from trying to squash anyone who's just asking questions, and what's wrong with asking these questions in the first place? If this hypothesis is just flat out wrong and doesn't include any medical advice at all, why does it need to be removed from every corner of YouTube and censored? I've seen Dr. Thomas Cowan's videos and he makes sense, and particularly so having read Dr. Arthur Firstenberg's book, *'The Silent Rainbow: The History of Electricity and Life'*.

Thomas Cowan, M.D. hypothesizes that Coronavirus may be history repeating itself and linked to 5G. It was filmed at the Health And Human Rights Summit in Tucson, Arizona on March 12, 2020.

You Tube has removed his video stating it violated You Tube's terms of service. It has been re-posted and can be seen at this link: https://invidio.us/watch?v=bOeqy9_qS0A

Dr. Cowan is anthroposophical holistic medical doctor in San Francisco CA. He is the author of "Human Heart, Cosmic Heart", "Cancer and the New Biology of Water", "How

(and Why) to Eat More Vegetables”, principal author of *“Fourfold Path to Healing”* and co-author of *“The Nourishing Traditions Book of Baby and Child Care”*.

Dr. Cowan’s article references the work of Dr. Martin Pall: Massive Predicted Effects of 5G in the Context of Safety Guideline Failures.

There is much discussion in the EMF science community about the relevance of this theory. Some are dismissive, others are not. There are many unanswered questions on how 5G interacts with human health. Studies show wireless frequencies affect the immune system. Seems like it’s an important time to demand answers, and especially protect children from untested widespread technology use!

Dr. Cowan from what I know and have read about him believes the Wuhan, China is or was an accident, or side effect of China’s “Smart City” unveiling 5G. I have a somewhat different view on the Wuhan story. It is my view that it was a deliberate test to see if it could be used as a global depopulation “Silent Weapon” without the world knowing it was planned and intentional, and then passing off the symptoms of 5G as those of the Corona virus.

The evidence that I have read, including U.S. Navy classified “Top Secret” documents going back to 1950 clearly shows the Navy knew long ago the harm which results from wireless EMF radiation. Scientists and medical sources knew that 5G when “modulated” interfered with the human body’s ability to bond oxygen with hemoglobin required for the lungs to function. When the energy level is modulated up to the 60Ghz level, the EMF consumes 98% of the blood-oxygen in the lungs, resulting in instant death.

Numerous physicists, electrical engineers, bioelectrical medicine, have had years to test the technology of wireless communications. Tests on animals, and probably on humans as well have confirmed what will happen when a person is blasted with invisible EMF non-ionizing radiation.

It is my opinion, for what it is worth, China like all countries is confronted with an issue of feeding a growing population and cannot get around the peak growth issue. The Agenda 21/2030 enabled the UN to find a way to get rid of population without the collateral damage in a war of bombs, rockets, and artillery, i.e., a “Silent Weapon for a Quiet War”. The slip of the tongue made by Secretary of State, Mike Pompeo, that this was a “Live Event”, a military term for what we would call a test but with real ordnance. You do not have to believe me, but only an EMP weapon offers massive casualties without the use of explosives and munitions that destroy infrastructure.

The world’s super powers, U.S., Russia, China, are well aware of the old adage of MAD. Mutually assured destruction (MAD) is a doctrine of military strategy and national security policy in which a full-scale use of nuclear weapons by two or more opposing sides would cause the complete annihilation of both the attacker and the defender.

2019 CHILDHOOD VACCINE SCHEDULE

1962	1983	2019			
OPV	DTP (2 months)	Influenza (pregnancy)	Hep B (6 months)	Influenza (18 months)	Influenza (10 years)
Smallpox	OPV (2 months)	Tdap (pregnancy)	Rotavirus (6 months)	Hep A (18 months)	HPV (10 years)
DTP	DTP (4 months)	Hep B (birth)	DTaP (6 months)	Influenza (30 months)	Influenza (11 years)
5 Doses	OPV (4 months)	Hep B (2 months)	HIB (6 months)	Influenza (42 months)	HPV (12 years)
	DTP (6 months)	Rotavirus (2 months)	PCV (6 months)	DTaP (4 years)	Tdap (12 years)
	MMR (15 months)	DTaP (2 months)	IPV (6 months)	IPV (4 years)	Influenza (12 years)
	DTP (18 months)	HIB (2 months)	Influenza (6 months)	IPV (4 years)	Meningococcal (12 years)
	OPV (18 months)	PCV (2 months)	Influenza (7 months)	MMR (4 years)	Influenza (13 years)
	DTP (4 years)	IPV (2 months)	HIB (12 months)	MMR (4 years)	Influenza (14 years)
	OPV (4 years)	Rotavirus (4 months)	PCV (12 months)	Influenza (6 years)	Influenza (15 years)
	Td (15 years)	DTaP (4 months)	MMR (12 months)	Influenza (7 years)	Influenza (16 years)
	24 Doses	HIB (4 months)	Varicella (12 months)	Influenza (8 years)	Meningococcal (16 years)
		PCV (4 months)	Hep A (12 months)	Influenza (9 years)	Influenza (17 years)
		IPV (4 months)	DTaP (18 months)	HPV (9 years)	Influenza (18 years)
					72 Doses

WHAT HAPPENED IN 1986?

- In 1986, Reagan passed a law that gave legal immunity to vaccine manufacturers.
- They could no longer be sued for injuries or death caused by their products. Safe vaccines wouldn't need such protection.
- Once that law passed, we suddenly 'needed' 48 additional doses of vaccines. (Do you remember any outbreaks in 1989?)
- Also, since that law was passed, U.S. Federal Government has paid out more than \$4 Billion in vaccine injury compensation, and that's only a fraction of actual injuries.
- The U.S. gives more vaccines than most developed countries, yet we have the sickest kids.

GUESS WHAT?

The CDC has only ever tested MMR and Thimerosal for a link to autism. The remaining 13 vaccines and 37 common ingredients remain untested for links to autism.

THERE ARE RISKS | YOU HAVE CHOICES

Above is a copy of the 2019 childhood vaccination chart required from birth to the age of 18. The insanity of this is today 50% of all school children have allergies, side effects of those vaccines required regardless of medical or even religious objection. We are now seeing the saturation of the childhood and teenage population and we hear of repetitive statements about the need to vaccinate the adult population, so the pharmaceutical companies can continue to enrich their wallets at the cost of your pain.

"We want to get everyone vaccinated and then we'll have an RFID chip implanted in them so we can track them."

- Bill Gates, Reddit AMA, April 2020

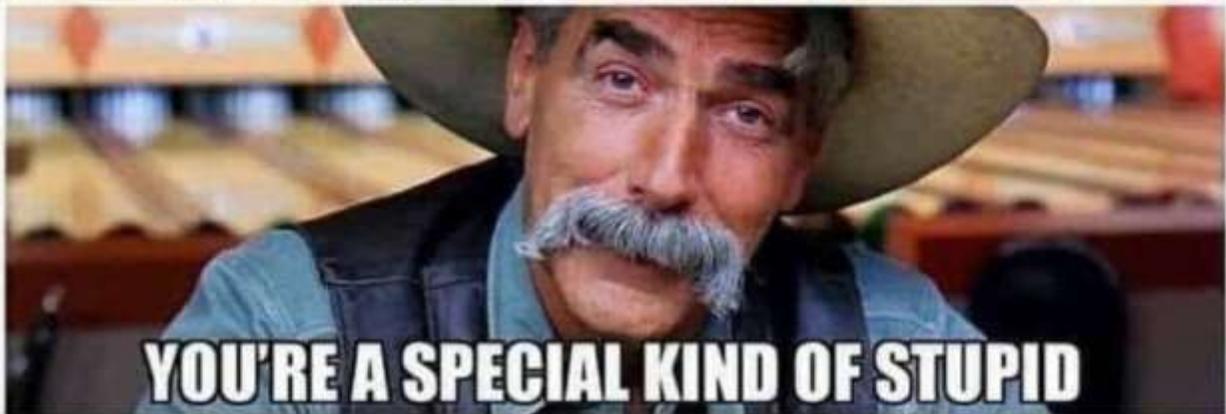

Share this information series!

This cartoon by Ben Garrison is satire humor but I see it has prophetic; the reality is that the UN Agenda 21 and Agenda 2030 will require vaccination as mandated by law. Lunatics like Dr. Anthony Fauci, Dr. Robert Redfield, and college dropout Bill Gates will see to it that everyone in your household is injected more than once in their living years.
